GO: Cryogenic Fluid Management
NASA Space Technology Mission Directorate

STMD welcomes feedback on this presentation. Please visit https://techport.nasa.gov/framework/feedback if you have any questions or comments regarding this presentation.
GO: Develop cryogenic storage, transport, and fluid management technologies for surface and in-space applications.

Developing technologies for near zero boil off storage, high efficiency chill-down and liquefaction, propellant transfer, and instrumentation to support Mars transportation and surface ISRU architectures.

STORAGE
- LOX, LCH4, LH2
- Near Zero Boil-off – Architecture / mission dependent

• Critical Technologies
  - Active Thermal Control
  - High Performance Insulation
  - Structural Heat Rejection/Intercept
  - Pressure Control
  - Operations
  - Near Zero Boil-off
  - Structural Multilayer Insulation
  - Low conductance structures
  - High Efficiency High Capacity 20 K and 90 K Cryocoolers
  - Destratification
  - Unsettled Mass Gauging
  - Thermal Control Coatings

LIQUEFACTION
- H2, O2, CH4
- Initial system performance:
  - 2 kg/hr of O2 and 0.3 kg/hr of H2
- Soft Vacuum insulation: 1.5 W/m2 at 250 K

TRANSFER
- Propellant losses ≤1% during transfer
- <1% residual in supply tank

• Critical Technologies
  - Component Technologies
  - Operations
  - High efficiency chill down of tank and lines
  - Automated Cryo-Couplers
  - Low-leakage valves/actuators
  - Flow Meters
  - Efficient Liquid Acquisition Devices
  - Transfer pump

NON-PRIMARY PROPULSION
- Integrated RCS
- Fuel Cells
- ECLSS

• Application Specific CFM Capabilities
• Uses components and processes from other categories

INTEGRATED OPERATIONS / PREDICTIVE PERFORMANCE
• Advanced instrumentation, data acquisition and signal processing
• Integrated Demonstration
• Accurate and robust a priori microgravity thermal-fluid predictions
  - Validated foundational physics in High Fidelity tools
  - High-to-Low Fidelity Model Integration
• Integrated System Performance Analysis
  - Low predictive uncertainty
CFM State of the Art

CFM capabilities must address the operational implementation and use of the technologies in a system, and the technical design of the CFM system. Many of the components required to close the gaps are the same but have diverging requirements or implementation strategies that change how the technology is used.

**STORAGE**
- Extensive experience in ground demonstration
- Longest H₂ cryogenic propulsion storage system has performed storage operations in space is 9 hrs
-Performed 4.5 Month CH4 subscale storage on RRM3

**KEY Design Details**
- Tank pressure regulation
- Methods of venting
- Structural heat load
- Total heat input over time
- Active cooling – 1W lift @ 20 K; 20W lift @ 90 K

**LIQUEFACTION**
- Ground based demonstration and analytical performance model validation of LN₂

**KEY Design Details**
- Condensation, fluid physics, fluid purity
- Active cooling integration
- High performance insulation in appropriate environment

**TRANSFER**
- Component brassboard hardware ground testing only

**Key Design Details**
- Pump or pressure driven transfer
- High efficiency chill down of tank and lir
- Active cooling
- Low-leakage valves/actuators, leak detect
- Phase separation/Liquid acquisition

**NON-PRIMARY PROPULSION**
- Ground based testing of Integrated RCS in thermal vacuum

**KEY Design Details**
- Application specific technologies and operational processes

**INTEGRATED OPERATIONS / PREDICTIVE PERFORMANCE**
- Fluid property knowledge gaps
- Instrumentation
- Model development and validation for both high and low fidelity applications

**KEY Design Details**
- Zero-G Mass Gauging
- Operational and predictive fluid dynamics and thermodynamics

- NASAs CFM Portfolio has contributed extensively to bringing CFM critical technologies to TRL 4-6
- Significant SBIR program leverage
- Nearly all are receiving active investments
- Recent focus has been on advancing the CFM component and subsystem technologies beyond the mid-range TRL level and developing integrated flight demonstrations to support NASA’s future missions
- Future focus will be closing out the current lower TRL investments and development of the near-term flight demonstrations
- HLS Leverage for multiple components
- Industry leverage (e.g. Lockheed Martin, Blue Origin, SpaceX, Eta Space, etc.)
- SMD ZBOT demonstrations and model validation
- High to low fidelity model development and validation to predict future mission capabilities

* Note: Traditional settled pressurization methods TRL 9
** Note: Addressing the gap does not in all cases equate to gap closure; some gaps are fluid or architecture specific; the goal is to develop high-fidelity models to support mission designs.
CFM Investment Approach

Ground Development (Current CFM Projects)
- Multiple ground-based component and subassembly projects addressing the CFM critical technologies
- Many of these lower-level capability demonstrations are advanced in technology readiness through the Tipping Point integrated system demonstrations
- CFM technologies supporting ISRU architectures do not require micro-g and TRL can be advanced to 6/7 in ground testing.

Near-Term Demonstrations (FY20 Tipping Points)
- STMD is sponsoring a significant Tipping point award to incentivize Industry to fly CFM experiments that will combine many of these CFM technologies to develop and raise the TRL level of storage and transfer
- Four flight demonstrations have been selected for award and are expected to fly by 2025
- Significant technology maturation is stalled in wait of integrated system and/or relevant environment testing

Large Integrated Flight Demonstration
- Evaluating Options

Leverage the Human Landing System (HLS) Development and Demonstration
- Utilizing the data and performance gathered during the Near-Term Demonstrations and other mature enabling and enhancing technologies, the CFM individual systems will be demonstrated in a scalable flight experiment directly addressing the performance needs of CFM stakeholders.
- Post flight, CFM technologies will be ready to support NTP and other deep space Cryo stage missions

Operations Optimization
CFM technology maturation has a realistic path to enable storage and transfer capabilities in time to support the future NASA missions.

CFM Notional Near-Term Roadmap

Notional Timeline
Capability Gap Performance Goals

**Storage**
- Lunar Human Return/Exploration: Cryogenic propellant storage with near zero boil-off dependent on architecture and mission duration; LOx, LCH\textsubscript{4}, LH\textsubscript{2}
- Long Term Lunar/Mars/ISRU: Zero Boil-off (net head load of less than zero); LOx, LCH\textsubscript{4}, LH\textsubscript{2}; includes thermal insulation and structural interfaces limiting heat leak into tanks

**Transfer**
- Propellant losses of 1% (TBR) or less during transfer activity
- <1% (TBR) residual in supply tank

**Liquefaction**
- Integrated system performance of 2 kg/hr of O\textsubscript{2} and 0.3 kg/hr of H\textsubscript{2}
- Fluids to demonstrate: LOx, LCH\textsubscript{4}, LH\textsubscript{2}

**Predictive Model Validation**
- Demonstrate that the relative difference between CFD or nodal model results and test data is less than 15% (TBR) for pressure time histories and less than 30% (TBR) for (fluid and/or wall) temperature time histories
  - Sufficient for acceptable performance margin (TBD) of operational systems
Acronyms and Abbreviations

- ACO: Announcement of Collaboration Opportunity
- BAC: Broad Area Cooling
- CELSIUS: Cryogenic Encapsulating Launch Shroud and Insulated Upper Stage
- CFM: Cryogenic Fluid Management
- CLPS: Commercial Lunar Payload Services
- Cryo: Cryogenic
- ECI: Early Career Initiative
- ECLSS: Environmental Control and Life Support System
- FBCE: Flow Boiling and Condensation Experiment
- FO: Flight Opportunities
- FY: Fiscal Year
